## BULocalization Activation Key [Mac/Win]

BUTranslation makes sure that all program strings are translated on your target system. To load the language options for your program, you simply create an instance of the BUTranslation class, call the TranslateFile method and load the relevant file.

**BUTranslate Description:** This program can translate strings, comments and other strings and comments in the program code itself. TranslateCodeTranslateStrings( ) TranslateCommentTranslateStrings( ) Use them to translate strings, comments and other strings and comments in the program code itself. You should always use these methods in the very end of your program and only for a small amount of strings. This method saves a lot of lines of code and improves program readability. Use TranslateStrings( ) to translate LocaleManager.LocaleTranslateString( ) LocalizationTool In Action BULocalization supports the following languages: BUTranslate is developed by: Paul "Junior " Johansson BULocalization is developed by: Paul "Junior " Johansson This software is distributed under the GNU Public License. ## BULocalization [Win/Mac]

A Macro for.NET BULocalization is a wrapper around a.NET Dictionary KeyManager. All its methods works like the dictionary methods. You can add, remove and get the keys of the dictionary. You can use its methods like the Dictionary methods. You can use the functions of the KeyManager class like the Dictionary class methods. Kernel of BULocalization: BULocalization is a set of.NET wrapper classes on the KEYMACRO class that can be used to handle Localization (key management). You don't need to care about languages of your program, it handles it all for you. What you need to do is just to tell to the program what is the language of the KEYMACRO. BULocalization supports all key managers that can handle the.NET application: Dictionary, HashTable, SortedDictionary, SortedList, XmlDocument and XmlReader classes So you can use the Localization (key management) even in the languages that don't support them natively. What you need to do is to let to the user of the program what language to use. So the user can select the program language and then the program will use the Localization. BULocalization implements KeyManager as it was a KeyManager class in KEYMACRO. BULocalization uses all supported types of KEYMACRO like this BULocalizationKeyManager keyManager = new BULocalizationKeyManager(Dictionary); and the user can pass to the program a KeyManager implementation keyManager = new BULocalizationKeyManager(HashTable); Every keys of the dictionary (HashTable) becomes the keys of the BULocalizationKeyManager keyManager. All the keys (KeyNames) of the dictionary (HashTable) will be a key in the keyManager. When the key is added to the keyManager, it will be deleted from the dictionary. When the key is removed from the keyManager, it will be deleted from the dictionary. The keys of the dictionary are the keys in the main program and not the language keys. You can use the methods of the keyManager as the keyManager methods. For example If the user has set the default program language to the "en" The key names: BULocalizationKeyManager keyManager = new BULocalizationKeyManager(Dictionary); 77a5ca646e

## BULocalization Crack Free

----- \* BULocalization is a set of tools to make localization of .Net programs easier and quicker. \* All what you need to do is just to use ready decisions and adopt it to your needs. \* BULocalization is in fact a package that consists of 2 programs and class: \* BULocalization manages localizations \* BUTranslate helps to translate programs in different languages \* BUTranslation class for loading language options By using BULocalization your program can automatically load current system language setting. And you can change current locale and set it to your needs. BULocalization will autoloading language options and sets them to your current locale. BULocalization will automatically configure Windows Language and Regional Options depending on current locale. \* Built-in \*.txt files for localization (french, italian, spanish, dutch, german, english, japanese) \* configuration: o for newline \* \l for spaces between phrases \* \x for spaces between words \* \* for entire line Installation: ----- \* Get and unzip BULocalization package (v 1.1.12.18.0) in an appropriate location of your computer. \* Add BULocalization folder to your project (copy it and paste it into the solution folder) \* Make sure BULocalization folder is in the same directory with the other files in the solution. Programs ----- BULocalization contains two programs, BUTranslate.exe and BULocalization.exe. BUTranslate converts any.exe to other languages (english, french, italian, spanish, dutch, german, japanese). BULocalization will load current settings of Windows Language and Regional Options for you. BULocalization ----- \* BULocalization is a set of tools to make localization of .Net programs easier and quicker. \* All what you need to do is just to use ready decisions and adopt it to your needs. \* BULocalization is in fact a package that consists of 2 programs and class: \* BULocalization manages localizations \* BUTranslate helps to translate programs in different languages \* BUTranslation class for loading language options BULocalization is a set of tools to make localization of .Net programs easier and quicker. \* All what you need to do is

## What's New In?

This project consists of 2 programs: BULocalization and BUTranslate. BULocalization is a GUI for loading, adding and managing localizations. It has an interface to edit config files and translate them to other languages. BUTranslate is a console program that enables loading and using of translated language settings. Currently it supports: - load from xml files - load from en.xml file - load en.xml file from any source - load from jar files - load from zip files - compile resource files from scratch (support classLoader class) It supports: - load and use from xml config files - search for existing localized resources - show all resources in project - translate to other languages Using: BULocalization will work with the IDE of your choice (Visual Studio, Eclipse, NetBeans, etc.). The program has an interface to load, edit and compile resource files and translations from scratch. The program comes with a windows application with 2 tabs: - Resources tab is responsible to manage the Localizations: add, remove and edit them. - Translation tab is responsible to load, translate and search for existing translated resources and add them to the resources tab. The program also comes with an external config file: - Localization.xml It has a structure in which you can add your translations. Each translation is an object with information about the string, the source language and the target language. A translation class is responsible to search for existing resources (maybe the same string was already localized) and use them. You can compile the resource files to the bin\deploy folder of your project and it is possible to create a resx file from the compiled ones. The program will translate it when you run it. BUTranslate is a console application that enables loading and using of translated language settings. It has an interface to compile the resource files from scratch. You can also define a base path where the program will search for existing translations from this point on. If you use it for compile your.resx files to the bin\deploy folder of your project, the program will automatically translate them when you run it. BULocalization has 2 projects: BULocalization.csproj BULocalization.sln Bug Reporting: If you find any bug or issue with this software, please email it to me. I will quickly respond to you and fix it. Team Members: BULocalization project is a collaboration between me and 2 other programmers (Dirk Johansen and Steven Wagner). License: BULocalization is not released under any license. If you are using the compiled code for your project, you can use it as you wish. However if you are using it to translate your resources to other languages you must have a license for it. BUTranslate is released under the Apache 2.0

---

## System Requirements:

Windows XP, Vista, and 7 Windows Vista with 64 bit enabled Windows 7 with 64 bit enabled 2 GHz+ Core 2 Duo or AMD 64 CPU 2 GB RAM 1366 x 768 1024 MB GPU with Direct3D 9.0 or higher Gamepad with HID 1 GB free HD space Might not be compatible with all game titles, but most game titles should work as expected. Languages: English Spanish
